

Dear Hiring Manager,

In my career, I've been an IC, a business owner, a software development manager, a system architect, and a director with multiple teams, overseeing 2x managers and 20x developers.

My background includes 10 years working with companies with \$250m/year+ in revenue and many years in startups. In this time, I've been exposed to many different paradigms and languages as technology continues to evolve.

My technical experience is in many different languages and paradigms, from cutting my teeth with bare metal and C/ASM, moving to Pascal and client/server with Oracle, securing venture capital and launching my own software company (twice) with PHP and learning to scale SaSS companies using Amazon AWS' vast ecosystem (Python, React, Go).

My most recent position was the Director of Software Development at a Seattle-based company that provides CRM software to property management companies around the world.

Initially hired as the Lead Software Developer in charge of the flagship product and its platform. I helmed the 10 person team from a budding startup, through its stabilization and ultimately its high growth and scaling phase, overseeing 2 managers and 4 teams of 20 developers. It's been a tremendous growing opportunity, and one that I'm very grateful to have experienced.

In these roles, I was accountable for establishing and leading SCRUM teams contributing to APIs (public and internal), integrations with external partners, scaling and maintenance of the "core platform" (AWS, Python), and helping to evangelize and provide best practices for DevOp.

Additionally, I have led the design and implementation of technologies to support application teams with a growing and scalable platform, consistently delivering value-add data solutions, optimizing cloud computing, exception based monitoring and alerting, CI/CD optimizations for deployments, data model performance tuning and efficiencies.

Lastly, I established and curated a Platform team to aid in the development of established design patterns, infrastructure, platform feature enhancement and aiding in the identification of engineering problems that have an overarching impact on agility and velocity.

I look forward to finding a position that gives me additional challenges in scaling of computing, growing and maturing teams and workflow, deep technical oversight of architecture, and building productive cross-team relationships.

Respectfully Yours,

Marvin "Vin" Colgin
